

GRAND and eGAPS

Capability & modernization assessment

For manual review with Budget, Accounting, Treasury, IT and management | 10 September 2026

Assessment: GRAND has a substantial Finance foundation, but is not yet a demonstrated replacement for the enabled eGAPS modules. Some workflow and administrative machinery is ahead of practical accounting coverage. Complete ordinary office work and match required outputs before expanding the surrounding frameworks.

Review boundary	Evidence and limitation
GRAND baseline	Assessment frozen at v0.7.71 (commit 2de0ce2), with v0.7.70 as the latest verified application baseline. Reviewed development checkout, not a production deployment or a claim about master. Later implementation work is outside this assessment.
Live eGAPS inspection	Accounting and Budget menus were navigated; the already-open DV register was inspected. Accounting, Budget and Cash Disbursement were enabled in the launcher. Other municipal modules were visible but disabled in this session.
Interrupted inspection	The launcher subsequently disappeared. JEV register navigation displayed: "Incomplete write when writing to the server. (735)." Cash Disbursement internal screens were not reviewed. No repair or reconnection was attempted.
Safety and evidence	No eGAPS Save, Edit, Delete, Post, Approve, Release, Print or Export actions were performed. No direct eGAPS database work was performed. A visible menu proves an exposed option, not hidden validation or numerical correctness.
Validation boundary	GRAND source, tests and progress documents were inspected; no new tests or migrations were run for this assessment. Its database hash matched the recorded baseline. No numerical comparison with eGAPS output or named-user acceptance was performed.

Review convention: "implemented" means present in GRAND source and its recorded software evidence. "Needs matching" may mean missing code, an unverified complete workflow, or local form/operational acceptance; these are distinguished in the tables.

1. Budget and voucher coverage

Area	Observed in eGAPS	GRAND at the reviewed baseline	What needs to match
Budget preparation	Projected receipts, office proposals, financial-assistance proposals, special-purpose proposals, fund-operation and statutory statements.	Calls, ceilings, proposals, resource estimates, classifications, targets, consolidation and version review are implemented.	Demonstrate each locally used proposal and schedule without rebuilding it in a separate spreadsheet. Generic proposal coverage does not prove every form.
Appropriation authority	Continuing appropriations, current appropriation approval, augmentation and supplemental-budget options.	Final, supplemental and reenacted authorization; continuing/statutory line classifications; immutable authority records.	Demonstrate augmentation and continuing-appropriation treatment. A classification label alone does not prove the complete procedure.
Budget execution	Local Budget Matrix, Allotment Release Order, Financial Plan, Advice of Allotment, available-appropriation certification, OBR and correction/adjustment entries.	Substantial allotment and obligation controls, balances, certification, adjustments and correction lineage.	Match each document, numbering, timing and approval route. A general control-register export is not automatically an equivalent of every document.
Budget accountability	Appropriation/allotment/obligation statements, balances, statutory/contractual statements, long-term obligations and several registry variants.	Budget accountability and budget-versus-posted-actual datasets are implemented.	Match the reports individually, especially long-term obligations, statutory/contractual schedules and the distinct registry variants.
DV processing	Live register with fund/month/year/type filters, sorting, copy-count/printing controls, JEV posting, release and transmittal actions.	Shared case, payable intake, documentary checks, deductions, controlled copies, wet-signature tracking and custody history.	Match encoding speed, search, batch handling, transmittal practice and exact printed packets. More explicit controls do not establish better clerk productivity.

Colleague notes / reference form or example:

2. Accounting and statutory-output coverage

Area	Observed in eGAPS	GRAND at the reviewed baseline	What needs to match
JEV lifecycle	Entry, approval/cancellation and cancelled-record menus.	Balanced journals, independent posting, returns, reversal, period control and source-linked entries.	Confirm recognition timing and correction procedures. eGAPS exposes approval/cancellation; it cannot be characterized as having no controls.
Earlier accrual / existing payable	Payable schedules and JEV paths are exposed; the complete settlement sequence was not verified.	Confirmed incomplete route: DV validation blocks earlier-accrual and existing-payable settlement choices pending the linking control.	Implement the earlier-payable linkage and settlement path without duplicate recognition. This requires software work, not only form approval.
Collection and deposit	Dedicated collection/deposit path and Report of Collection and Deposit Files.	Manual journals exist; no dedicated collection/deposit source workflow was found in the inspected Finance implementation.	Source capture, receipt/deposit controls, journal linkage, corrections and corresponding output. Manual journals alone do not establish parity.
Cash advances / liquidation	Separate Liquidation Report path under disbursements.	Cash-advance/liquidation variants, documentary rules and a liquidation posting decision exist.	Demonstrate the complete chain, outstanding balances, refunds/additional claims and liquidation reports. Present coverage is partial evidence.
General / subsidiary ledgers	General ledger, subsidiary ledger, subsidiary schedules, payable schedules and withholding schedules.	General ledger and trial balance; dedicated subsidiary categories currently cover payables and withholding.	Inventory actual subsidiary accounts used by the LGU. Broader receivable, advance or other requirements need separate implementation/evidence.
Tax outputs	Withholding schedules and explicit BIR 2306 / 2307 options.	Governed withholding, source schedules, remittance and external filing evidence. Presets distinguish these from issued certificates or filed returns.	Demonstrate required certificates, layouts, grouping and corrections. A certificate-source dataset is not an issued certificate.

Colleague notes / reference form or example:

3. Statements, Treasury and platform coverage

Area	Observed in eGAPS	GRAND at the reviewed baseline	What needs to match
Financial statements	Trial Balance, Financial Position, Financial Performance, Cash Flow, Changes in Net Assets/Equity and Budget-versus-Actual.	Position, Performance, trial balance and budget-versus-actual are implemented. No dedicated Cash Flow or Changes in Net Assets/Equity implementation was found.	Complete missing statements and reconcile to accepted outputs. Cash-position controls are not a Cash Flow Statement.
Checks / bank advice	Accounting exposes Accountant's Advice, Reports of Checks Issued and Check Disbursements. Cash module internals were not inspected.	Instruments, advice batches, acknowledgement, release, returned payments, replacements and remittances are implemented.	Verify Treasury practice and exact RCI/RD/advice/check outputs. Full Cash Disbursement parity remains unproven.
Bank reconciliation / closing	Closed-trial-balance setup was visible; detailed reconciliation behavior was not verified.	Statement staging/matching, outstanding-item carry-forward, independent reconciliation, close/reopen and cash controls exist.	Consecutive-month replay and cross-period corrections. Substantial implementation does not prove comparative superiority.
Navigation / work tracking	Fixed desktop screens, maintenance-file menus and dense registers; user/group access and audit menus.	Role-shaped web workspaces, shared case history, My Work, personal Waiting/Returned/Completed views, private saved views and responsive templates.	Actual clerk walkthroughs and realistic workloads. Generic following, shared views and notifications remain deferred.
Wider municipal services	Numerous launcher modules were disabled in the inspected session.	Assistance, citizen services, social-welfare operations, records, custody and employee features broaden GRAND's scope.	Treat these as separate coverage. They do not compensate for missing Finance outputs or prove superiority over disabled eGAPS modules.

Colleague notes / reference form or example:

4. Is GRAND over-engineered?

Judgment: partly. Preserve the financial safeguards, but simplify the operator experience and direct more effort toward complete daily transactions and outputs. The assessment is about implementation priorities and usability, not proof that eGAPS lacks comparable safeguards.

Design area	Assessment	Recommended direction
Exact money, balancing, independent approval, immutable history	Justified: these directly protect correctness and accountability.	Preserve the controls and their correction/reversal paths.
Shared transaction history	Worthwhile: can reduce duplicate encoding and status enquiries.	Demonstrate that facts entered once carry through the everyday workflow.
Two stores and recovery handoffs	Real complexity with an established boundary. Actual routing sends Accounting/Budget to Finance; setup, vouchers and reporting remain in default.	Preserve separation. Keep synchronization/recovery implementation detail out of routine clerical work wherever possible.
Versioned setup and outputs	Useful, potentially burdensome to administer.	Supply reviewed defaults and practical preparation tools. Measure the effort for an ordinary rule/form change.
Discovery, qualification, acceptance and cutover subsystems	Strongest over-engineering risk in sequencing: substantial machinery exists while accounting essentials remain incomplete.	Retain safeguards, but complete missing operational coverage before expanding this machinery.
My Work / personal-history adapters	Useful foundation; further expansion has diminishing priority now.	Validate existing coverage with employees before adding collaboration features.
Technical language on daily screens	Current templates expose compatibility projections, pinned evidence and checksums beside transaction work; some details are already collapsed.	Lead with reference, amount, status, responsible office and next action. Place technical evidence in expandable audit details.
General reporting framework	Useful platform, not proof of completed reports.	Measure progress by accepted outputs produced correctly, not by configurable mechanisms or menu counts.

5. Accepted direction and priority work

User direction accepted on 10 September 2026: improve the eGAPS experience through GRAND, with familiar office workflows, individual accounts, web access and authorized work-from-home options. Make future national-government, COA and DBM rule/form changes manageable.

Priority	Work	Completion evidence
1 - Functional gaps	Cash Flow; Changes in Net Assets/Equity; earlier-accrual/existing-payable settlement; confirm collection/deposit scope.	Source-to-ledger-to-output examples, including corrections and exact reconciliation.
2 - Complete inventory	Cash Disbursement screens, journal books, liquidation, subsidiary coverage and exact Budget reports.	Bounded inventory of actually used functions and outputs; unavailable areas explicitly marked.
3 - Daily office scenarios	Supplier bill, previously recognized payable, cash advance/liquidation, collection/deposit, returned check and month-end.	Authorized redacted examples with matching amounts, references, timing and documents.
4 - Output fidelity	DV, OBR, JEV, advice, RCI/RD, certificates and required statements.	Accepted layouts, overflow, signatories, copy counts and printer results.
5 - Familiar web UX / WFH	Register navigation by account; clearer next actions; less repeated encoding. Identify tasks that still require on-site signatures, printing or custody.	Clerk walkthroughs; observed search/correction/encoding effort; authorized remote-account and network-failure exercises.
6 - Change management / assurance	Reviewed effective-dated rules/forms; prior-output reproduction; native concurrency, recovery, access boundaries and real acceptance.	Successful change/recovery rehearsals, native validation and responsible-office sign-off. A new accounting behavior may still need code and tests.

Recorded software baseline: v0.7.70 passed 711 MySQL tests. SQLite discovered 711, with 710 executed and one native-only skip. v0.7.71 added an audit, not a new application pass. Further native scrutiny is environmentally blocked by Docker startup in the handoff. Passing existing tests does not cover missing functionality.

Recommendation: pause additional framework/collaboration expansion while completing a small, fully usable Finance scope. Production remains NO-GO until functional, operational, recovery and LGU acceptance gates pass. eGAPS remains untouched and is not required for GRAND runtime.

6. Colleague checking sheet and evidence references

Use this sheet to record corrections to the assessment. Select one status per item: Confirmed / Needs correction / Not used here / Needs demonstration. Attach only approved blank or redacted examples; do not include credentials or unrestricted production records.

Assessment item / page	Status and correction or missing requirement	Reference form / example	Owner / next step

Review meeting: _____ Office(s): _____ Reviewer(s): _____

Colleague notes / reference form or example:

Evidence references in the GRAND repository

Live observation: authorized read-only eGAPS session on 10 September 2026. No proprietary source or production record values are reproduced here. The interpretation of current national/COA/DBM requirements was not independently refreshed in this comparison; qualified LGU owners must confirm applicability.

Source checks: reporting/datasets.py (dataset registry); reporting/models.py (statement types); reporting/presets.py (tax and official-output boundaries); accounting/models.py (subsidiary categories); vouchers/services.py (earlier-accrual/settlement blocks); src/database_routers.py (actual store routing).

Progress and direction: CONTINUE.md; docs/FINANCE_ROADMAP.md; docs/FINANCE_MODERNIZATION_PRIORITIES.md (M01-M08); docs/FINANCE_NATIVE_INVARIANT_AUDIT_2026-09-09.md; docs/FINANCE_WORK_VIEW_COVERAGE.md; docs/FINANCE_TRANSACTION_POSTING_RULES.md. Where older prose conflicts with the inspected source, the source findings in this assessment take precedence.

This checking sheet records discussion, not production cutover approval or certification of compliance.
